

## Alla's Comments

1. Separate plots according to different attributes - as there are too many of them plotted together, it is hard to read the graphs.
2. We should pay more attention to descriptive statistics, as during the presentation we talked a lot about outliers
3. Clustering section:
  - (a) Check clustering section for typos;
  - (b) Back up the theoretical part: add some formulas
  - (c) Check the linkage method for hierarchical clustering
  - (d) Elbow rule for K-means
  - (e) Check the scaling so that the graphs are readable. It is better to plot just one cluster and show just part of observations more detailed
4. General requirement for all the graphics: transparent background
5. In the beginning of the quantlet all the libraries downloaded and all the packages used in the following analysis should be mentioned
6. There is a helpful book in MVA (Alla said "our book" but I am not sure whom she referred to. Maybe she meant this one)
